Autologue Releases New Version of its Datatron Management System

By aftermarketNews staff

Tuesday, February 05, 2008

BUENA PARK, CA -- Autologue Computer Systems has announced the latest release of its Datatron Business Management software.

This new version features enhancements made to improve the performance and efficiency of the product, and also includes new features to extend its functionality. The Datatron Business Management software, with its integrated accounting, was designed to be a complete, flexible single- and multi-store distribution solution.

According to Autologue, significant changes were made to the inventory files and programming. More price fields were added and the sub-lines expanded from one to three characters. A number of other smaller changes were also made based on user feedback. Datatron's Price Exception programming was enhanced to provide more ways of calculating customer prices, and more options were added to the Delayed Reordering programs for better control over its use in the ordering process. Color was added to the Datatron system. If using PCs, screen colors can be changed on a per-terminal basis. This allows users to not only vary the color of the background, but also choose a different color for "label" text versus text that is "data."

Some of the other key enhancements to the latest software release for the Datatron include:

• Invoices and pick tickets can now be sent to a laser printer with an optional bar code on the invoices if the scanned copies are being uploaded to Autologue's ePaperlessOffice.

• Wi-Fi Barcode Scanners and printers can now be used to pull pick tickets and receive orders.

• Pick Tickets can now be sent to different printers based on customer number or range, as well as the type of pick ticket (ePartConnection, Stock Order, Transnet Order, etc.)

• New programs were added to make it possible to change line codes and/or item numbers and make the change in every file on the system and not just in the inventory file.

• Additional options for selecting customers when running AR Aged Trial Balance, Collection Reports and Statements.

• A fourth aging field in Accounts Receivable has been added to further distinguish overdue invoices.

• The creation of a text file when running Payroll and Accounts Payable, which can be transmitted to a bank's website or software to electronically transfer the payments.

• Integration of Autologue's eDelivery Tracking System to allow customers to designate routes and track orders in transit online.

• Integration of Autologue's ePaperlessOffice to allow online access to statements, invoices and payments made by the jobber's or warehouse's customers, enabling them to get the info they want 24/7.
